

What can a space tell us?

CTIN 290 | Wednesday September 23 | SCI L104

Today's practice

Support a reading of a space with visible evidence.

Explain what changes when the audience can choose where to look.

Improve your video argument and make a useful change to your team's mood board.

Environmental storytelling

A space and its objects give us evidence from which to infer events, habits or relationships.

Try: Observe, then Reveal evidence

Visual Hierarchy

The order in which a composition makes elements noticeable through contrast, scale, placement and other visual choices.

Try: Attention: neutral versus controls

Agency

The ability to make meaningful choices in an interactive experience, within the options the work gives you.

Try: Explore versus Directed sequence

10:48-11:06 | Space analysis

Choose one source and timestamp or lab state. Name three visible details, a possible meaning, another explanation, and one choice that guides attention. Swap with another pair. Revise one sentence.

Your current projects

11:46-12:10 | Video clinic

Rehearse one claim using evidence from both forms. Give and receive I Like, I Wish, What If feedback. Write down one revision or missing piece of evidence. The video remains individual, 3-5 minutes, due tomorrow at 5 PM Pacific.

12:15-12:45 | Mood-board teams

Work on the actual shared file for your game involving collaboration. Choose one visual decision to clarify. Explain why a reference belongs, connect the palette to your intention and let every teammate contribute. Save your revision.

The final mood-board brief

20-40 images. Four criteria: Visual Cohesion; Curation & Justification; Color & Palette Development; Presentation & Accessibility. Five points each. File due October 1 at 5 PM Pacific. Five-minute presentations October 5; everyone speaks.

12:45-12:50 | Exit

One choice I can now explain with evidence is _____. One thing still unclear is _____. Download your notes before closing the page.

No new graded submission today

Use the established course Drive destination and current class instructions for the assignments.

[Full course rubric](#)

The workshop after the rain

The space lab room, viewed from above. Observe the full room. Name what is visible before deciding what happened.

What is the evidence?

Two workstations face each other across a long bench. One chair is tucked in, the other pulled away. A cup has tipped and spilled beside a wrench. Two separate control panels are cabled to a shutter. A window casts light across the floor.

The room supports more than one interpretation. Offer an observation, then a possible explanation, then an alternative. What further evidence would tell them apart?

Open the interactive version at the Space lab link on the student hub: Explore shows a close-up of each piece of evidence; Directed sequence fixes the order; the evidence labels can be revealed.

Look closer

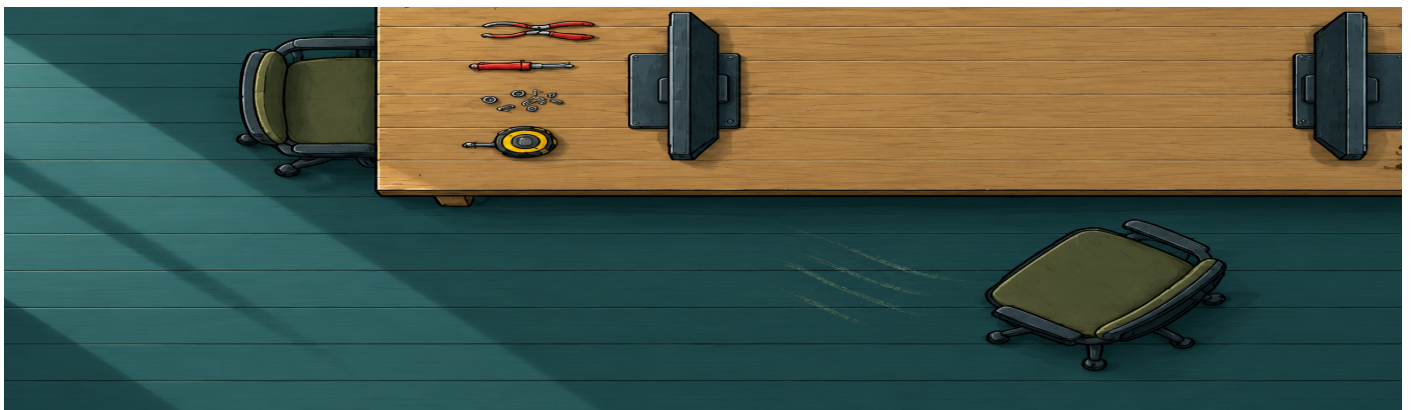

The same three pieces of evidence, up close. For each: what is visible, one possible meaning, one other explanation.

Separated controls. Two panels, two levers, one shutter. Coordination or a two-person job? Nothing here proves either.

The bench. Tools on both sides, two monitors, a tipped cup and its spill beside the wrench. Interruption, clutter, or work in progress?

The chairs. One tucked in, one pushed back and turned, scuffs on the floor. Someone left in a hurry, or just made room?
